There are billions of small transistors built on a single computer chip. The 4004 performed about 60,000 operations per second, using over 2,000 transistors and 640 bytes of memory. One of the fascinating features of a CPU is that it is able to get instructions from the RAM before it needs them. In 2017, Intel launched three new microprocessors, each with 14, 16, and 18 cores. Known as the CPU, this important component of your computer's hardware facilitates instructions between the "brain" part of your computer and the "mouth" (the output).
