What is selection in research. Selected guidelines for ethnobotanical research a field manual. Selection criteria for participants in research. What are the criteria for good research.

Bibliographic information Publisher: New York Botanical Garden All titles: "Selected guidelines for ethnobotanical research: a field manual"@eng Other: "ill. bibliographical ref.and index" This book provides essential guidelines for conducting ethnobotanical research and collecting plant specimens. Among the topics covered: protocols related to initiating and conducting fieldwork; ethical issues to consider; concepts and techniques for the collection of cultural knowledge, including interviewing techniques and the gathering of plant-use information; the importance of and techniques for the proper collection and preservation of plant specimens, including those of an unusual or difficult nature or requiring specialized treatment; methods of data collection and analysis, including methods for quantifying data relating to plant use, ethnobotanical behavior, and the distribution, abundance, and yields of plant resources. Extensive readings in a diversity of disciplines with different approaches to ethnobotany are included. Selected Guidelines for Ethnobotanical Research: A Field Manual, M. Alexiades, ed. Advances in Economic Botany, New York, The New York Botanical Garden Press. These resources are usually regarded as part of a culture's traditional knowledge. This study examines the use of medicinal plants in four indigenous groups of Mexican Indians, Maya, Nahuatl, Zapotec and - for comparative purposes - Mixe. With the first three the methodology was similar, making a direct comparison of the results possible. In these studies, the relative importance of a medicinal plant within a culture is documented using a quantitative method. For the analysis the uses were grouped into 9-10 categories of indigenous uses. This report compares these data and uses the concept of informant consensus originally developed by Trotter and Logan for analysis. This indicates how homogenous the ethnobotanical information is. Generally the factor is high for gastrointestinal illnesses and for culture bound syndromes. While the species used by the 3 indigenous groups vary, the data indicate that there exist well-defined criteria specific for each culture which lead to the selection of a plant as a medicine. A large number of species are used for gastrointestinal illnesses by two or more of the indigenous groups. At least in this case, the multiple transfer of species and their uses within Mexico seems to be an important reason for the widespread use of a species. Medicinal plants in other categories (e.g. skin diseases) are usually known only in one culture and seem to be part of its traditional knowledge...read moreJournal Article•DOI•Javier Tardío, Manuel Pardo-de-Santayana1•Institutions (1)06 May 2008-Economic BotanyAbstract: Cultural Importance Indices: A Comparative Analysis Based on the Useful Wild Plants of Southern Cantabria (Northern Spain) This paper compares four indices based on informant consensus Each index aims to assess the cultural significance of plant species and is suitable for statistical testing of different hypotheses For the comparison, we used data concerning plants traditionally used in the Campoo area of southern Cantabria in northern Spain Our results show a positive and significant correlation between the number of uses (NU) and the frequency of citation (FC) of the species It seems to be a general rule that the more versatile a plant, the more widespread its usefulness In addition, NU is highly influenced by the number of use-categories in the study Consequently, an objective index must rely on FC more than NU We propose the use of the cultural importance index (CI), which is defined as the summation of the informants' proportions that mention each of the uses of the species The CI index is highly correlated with FC and, although it also considers diversity of use, each use-category is conveniently weighted by the number of informants mentioning it Despite the use of cultural significance indices being questioned, we believe that indices based on in-depth, semi-structured interviews are still very useful for compilation studies of passive knowledge, such as most ethnobotanical works conducted in the last three decades in Europe...read moreBook•01 Jan 2004-TL;DR: Information is provided that will help forestry technicians, nutritionists, natural resource planners, policy makers and other stakeholders concerned appraise the opportunities and constraints in promoting the sustainable use of wild edible fungi...read moreAbstract: Wild edible fungi are an important group of non-wood forest products: they are used as both food and medicine and provide income to many forest users and traders. This publication reviews the characteristics of fungi biology and ecology, as well as fungi management and their importance to people. Information is provided that will help forestry technicians, nutritionists, natural resource planners, policy makers and other stakeholders concerned appraise the opportunities and constraints in promoting the sustainable use of wild edible fungi...read moreJournal Article•DOI•Tilahun Teklehaymanot1, Mirutsa Giday1•Institutions (1)14 Mar 2007-Journal of Ethnobiology and EthnomedicineTL;DR: An ethnobotanical study to investigate the uses of medicinal plants by people in Zeje Peninsula, northwestern Ethiopia found that the medicinal plants that are widely used by the local people or used as a remedy for a specific ailment have higher FL values than those that are less popular or used to treat more than one type of ailments...read moreAbstract: An ethnobotanical study was conducted from October 2005 to June 2006 to investigate the uses of medicinal plants by people in Zeje Peninsula, northwestern Ethiopia. Information was gathered from 200 people: 70 female and 130 males, using semistructured questionnaire. Of which, six were male local healers. The informants, except the healers, were selected randomly and no appointment was made prior to the visits. Informant consensus factor (ICF) for category of ailments and the fidelity level (FL) of the medicinal plants were determined. Sixty-seven medicinal plants used as a cure for 52 ailments were documented. They are distributed across 42 families and 64 genera. The most frequently utilized plant part was the underground part (root/rhizome/bulb) (42%). The largest number of remedies was used to treat gastrointestinal disorder and parasites infections (22.8%) followed by external injuries and parasites infections (22.1%). The administration routes are oral (51.4%), external (38.6%), nasal (7.9%), and ear (2.1%). The medicinal plants that were presumed to be effective in treating a certain category of disease, such as 'mich' and febrile diseases (0.80) had higher ICF values. This probably indicates a high incidence of these types of diseases in the region, possibly due to the poor socio-economic and sanitary conditions of this people. The medicinal plants that are widely used by the local people or used as a remedy for a specific ailment have higher FL values (Carissa spinarum, Clausena anisata, Acockanthera schimperi, Calpurnia aurea, Ficus thonningii, and Cyphostemma junceum) than those that are less popular or used to treat more than one type of ailments (Plumbago zeylanicum, Dorstenia barnimiana)...read moreJournal Article•DOI•Abdolbaset Ghorbani1•Institutions (1)31 Oct 2005-Journal of EthnopharmacologyTL;DR: The folk herbal medicine among Turkmens of Iran is studied, finding some interesting and endemic species have been reported for medicinal uses, also some new uses for common species were documented...read moreAbstract: This paper is the result of ethnobotanical survey on the Turkmens of Golestan and Khorasan Province (Iran) conducted from June 2002 to the end of 2003. Turkmens are traditionally an isolated ethnic group residing in northern parts of Iran. We studied the folk herbal medicine among Turkmens of Iran. Totally, 136 species from 51 families were documented from which 120 species used as medicinal and 84 species mentioned by three or more informants. Information about plant uses is all summarized in Table 1. Some interesting and endemic species have been reported for medicinal uses, also some new uses for common species were documented. Some of these species are good targets for further analysis...read more
